

Release Notes

7800V Series

2.22d

20th Sept 2012

Enhancements:

- Added extra settings (NAT & Firewall) so user can disable/enable NAT or Firewall with PPPoE and PPPoA
- Added DSL PhyR setting to the DSL page
- Prevent IPv6 RADVD packet if no global IPv6 is present. Resolves MAC issue.
- Added two allow rules for DHCP and DNS in case user enables the LAN firewall and can still get the IP and access the internet. User now doesn't need to add these two ALLOW rules at the Incoming Packet Filter page for LAN.
- Change the date format from yy/mm/dd to dd/mm/yy in the voip call log to meet Australian requirements.

Fixes:

- Fixed issue whereby the 78VD crashes after system reboot if the LAN firewall is enabled and there are incoming packet filter rules.
- Fixed the typo for these two strings -- Australia and Belgium
- Fixed VoIP outgoing call log missing.
- Fixed the issue whereby " user get silence instead of tone after dialing *11# if the tone from PSTN is not normal dial tone".
- Fixed MAC 10.6.8 system hang issue
- Fixed Teamspeak issue

Known issues

- PSTN audio quality
- IE Bandwidth Issue
